Problems with the car

I had so many issues with the car. First off, the biggest one was the alignment and because I wanted to just use stuff I had at home all I found was glue dots and duct tape. With these things I was able to get the alignment right on Sunday, however after a while sitting there the glue dots started to fail after a while on sitting on the cardboard. I also had a problem with the cardboard being too flimsy, so I added a stronger piece of cardboard this helped strengthen the bottom but still lacked so much needed rigidity. I then went around my house, and I found a paint stick. I cut it to length and taped it onto the box. My car then was perfectly aligned. I added a string at the bottom to make sure the alignment stayed. However, over time the aligned came undone and downing testing it became unaligned again. If I could redo it I would buy stronger wood and either nail or super glue or do something that is much stronger than glue dots. Another problem I had was with the batteries, depending on the different batteries I would get a different motor reaction. After testing and testing at home I finally figured out Duracell would be the best bet to be more consistent. However, when I tested at school it did a different turn each time and went further or closer each time. No matter what I did I couldn't get any consistency at school. Another thing I ran into problems with was the battery's running out of juice and making the timing again different. The motors are also not consistent, sometimes one runs better than the other. I also had to test the sensors man many times to get them to be consistent. I was able to test them in my hallway at home and I had no problems after fixing the location of the sensors. During the test at school, I don't know what happened but one of the wheels failed to turn which in turn made the car fail the test. I am very upset about that fact. The wheels were another source of problem, after a while of testing I would notice that the wheel would also act differently each time I would run the car. Another huge problem of this test was the fact that I didn't know what surface the car would be tested on and after a lot of testing I couldn't find way to make the car perform the same on different surfaces. I don't believe there is a way to do this. This test was not a good show of the student's knowledge because there are too many variables in the car between the batteries the wheel motors surface, alignment light. Everything made the car act completely differently.
